

**EVA Enhanced Volume Assistant** is an APP for Smartphones and Tablets with Android operating system, developed to manage all SIP Audio over IP products of the **SipComStage** and **SipComPoint** AD600, AA-600, AA-500 series.

The APP allows you to:

- **View all Tema active devices on the network**
- **Adjust the volume of each selected device**

Once the APP is installed on your Smartphone/Tablet, which must be connected in wi-fi in the LAN network, with a click on "SEARCH" will be displayed all the Tema devices active in the local network, with the image of the type of device and model information, the programmed description of the area where it is located and other information such as the corresponding telephone number.

At this point the user can select a device and associate it with the mask of the selected systems on which it is authorized to control the streaming volume, the association is allowed after having introduced the serial number of the selected device.

Normally is the system administrator, aware of the serial numbers of the devices, which authorizes the users to operate on the volume control of the device in the area of its competence.

The APP can control the volume exclusively on the Multicast channel it is transmitting at that moment. The APP has no effect on the volume of the announcement coming from a SIP or Peer-to-Peer (P2P) telephone call for which the volume is programmable only by the system administrator.

The EVA APP is provided free of charge, with no limit on the number of users of the system.
